

Rub-R-Wall™

ALL POLYMER WATERPROOFING

Rub-R-Wall Waterproofing of BC Ltd was established in 2007 to address the growing concern of foundation coating in the lower mainland. Today, Rub-R-Wall is a company that offers a variety of competitive products with experienced applicators in both waterproofing and dampproofing.

Rub-R-Wall's greatest strength lies in its ability to provide a variety of dependable products. We work in conjunction with the engineers and the manufacturers to ensure that the products we use are applied to their specifications. With over twenty five years experience we offer comprehensive and reliable service.

Rub-R-Wall offers these products and services:

- Waterproofing - [Rub-R-Wall waterproofing membrane](#) is a state-of-the-art product based on advanced Hydrocarbon Polymer technologies. This technology produces waterproofing coatings which are VOC compliant and provide exceptional adhesion, incredible inherent strength and unsurpassed elasticity.

Features

Rub-R-Wall cures at ambient temperatures to form a seamless, impermeable, non-deteriorating rubber membrane that allows for expansion and contraction over a wide range of temperatures.

Uses

Rub-R-Wall's primary use is in vertical waterproofing where it affords positive waterproofing to foundation walls. It has excellent adhesion to most vertical surfaces such as concrete block, poured concrete, plywood and insulated concrete forms (ICF).

- [TREMproof 260](#) - Spray-Applied Waterproofing Membrane is a polymer-enhanced, single-component, fluid-applied asphalt emulsion waterproofing membrane. It is designed for spray application to concrete, masonry and other structural substrates, primarily in vertical installations.
- [TREMproof 250](#) - Aliphatic, rapid curing, high solids, VOC compliant, modified polyurethane waterproofing membrane that can be applied to "Green" Concrete.

- Dampproofing - we use quality products designed to help discourage water from adhering to, or penetrating, the material's surface.
- Foundation Wraps
 - [DMX Flexsheet](#) - DMX FlexSheet™'s air-gap membrane technology keeps basements dry, no matter what the weather or soil conditions. Unlike traditional foundation coatings, DMX FlexSheet™ bridges cracks and drains away moisture to the FlexTube™ footing drains. By controlling both interior and exterior moisture, DMX products virtually eliminate foundation leaks and expensive callbacks.
 - [TREMdrain](#) - a two-part prefabricated drain consisting of a formed core covered on one side with a non-woven needle-punched polypropylene filter fabric. This system provides both water collection plus a high profile section for water flow around the perimeter of the structure.
